## Occupation and separations in Sweden

This study aims to provide a descriptive picture of separations and divorces among different occupations in Sweden. Couples formed in 1999-2001 were followed up in 2009 to see whether they had separated or not. In this study, to form a relationship means either marriage, persons who entered a registered partnership or cohabitants having a child together. A separation means either by court dissolved marriage/partnership or cohabitants that have moved apart. The occupational groups presented are occupation at the start of the relationship. Data is derived from the Total Population Register, Historical database and STATIV database.

When it comes to divorces and separations is it common to point to correlations between different demographic factors and frequency of divorces. In Sweden, the risk of separation is higher if both are young at the beginning of the relationship. Three out of ten couples with a middle-age under 25 years at the start of the relationship had separated under the studied period. The share of separations is decreasing the higher the middle age was at the start of the relationship.

Another factor that increases the risk of separation is age differences. Four out of ten couples with an age difference greater than ten years between the partners had separated before 2010. If the difference were less than three years, nine out of ten were still a couple.

One further important factor that increases the risk of separation is differences in educational levels. Divorces and separations are more common among couples with a low level of education. For couples were both partners had pre-secondary education, almost three out of ten had went their separate ways while corresponding for couples with high education were 12 percent.

Table 1. Percentage of couples and percentage of separations after family status, average age, age difference, education, origin and occupation. 1999 – 2001 and 2009

|                        | Percentage |         |  |
|------------------------|------------|---------|--|
|                        | Percentage | of non- |  |
|                        | of couples | couples |  |

It is most common to separate among couples were at least one of them is working in the occupational group "Protective services". This includes occupations like firemen, security officers and prison officers. Almost every fourth person in these occupations that had formed a relationship in 1999 - 2001 had separated before 2010. A high share of separations is also found among people working as "Helpers in kitchens and restaurants", "Other sales and services elementary occupations", "Labourers in mining, construction, manufacturing and transport" and "Garbage collectors and related labourers". Occupations with the highest rate of separations often don't require any form of higher education.

The occupational group "Life science and health professions" has the lowest share of separations. Only one person out of ten within these groups had separated from its partner during the studied period. Other occupational groups with a high rate of separations are "Engineers and architects and related professions", "Agronomy and forestry technicians". Common for these occupations is that they require some level of higher education.

There are also connections between the distribution according to sex in an occupation and the share of separations. Separations are more common among couples were someone is working within a profession were the own sex is in minority. Largest share of separated men is found in occupational groups as "Helpers in restaurants", "Cleaners" and "Personal care and related workers". There are considerably more women than men working within these occupations. Among women, the largest share of separations is within occupations dominated by men, for example "Transport and mobile-plant operators", "Painters and welders" and "Garbage collectors and related labourers".

Other studies have shown that it is common to start a relationship with someone you are similar to when it comes to values and interests. The risk of separation seems to vary whether you have the same occupation or not. In Sweden, the most common profession to have a relationship with someone of the same profession is doctors and they seem to stay together.
